EDUCATION

University of Toronto

2023 – Expected Apr 2027

Bachelor of Applied Mathematics Specialist, Statistics Major, Computer-Science Minor

Toronto, ON

Relevant Coursework

Probability and Statistics I/II, Methods of Data Analysis, Multivariate Data Analysis, Statistical Computation, Data Structures and Algorithms, Algorithm Design and Analysis, Statistical Reasoning and Data Science

EXPERIENCE

Nextdoor

May 2026 – Present

Machine Learning Intern

San Francisco, CA

- Designed the family-friendliness scoring metric by researching candidate signals with stakeholders and engineering external API and internal data into a weighted, interpretable index.
- Processed tens of thousands of records through Databricks and SQL, comparing multiple model families before selecting the production scorer.
- Shipped the metric to production users, owning data processing, the backend scoring service, and the frontend that surfaces ranked neighborhood recommendations, plus bug fixes across the stack.

Shopify

May–Aug 2025

Software Engineering Intern

Toronto, ON

- Increased new-merchant activation and retention, routing roughly 100 merchants/day through guided onboarding, by launching a partner-attach system that automatically pairs each new merchant with a vetted onboarding advisor.
- Brought German VAT submissions into compliance with updated tax regulations, unblocking hundreds of affected merchants and reducing compliance risk, by integrating the German tax-code API and aligning Shopify's existing tax flows with the new legal requirements.
- Improved system reliability and reduced recurring issues by resolving cross-disciplinary technical debt assigned by adjacent teams, collaborating with engineering and product stakeholders to ship scalable fixes.

PROJECTS

Student-Outcome Analytics (OULAD), Independent Research [\[Report\]](#)

2026

- Analyzed 23,301 student-course records to surface early-warning signals for at-risk students, engineering engagement metrics observable before any grade is issued via standardized PCA and varimax factor analysis.
- Benchmarked classifiers under 5-fold cross-validation (logistic regression 67.0% vs. 53.0% baseline) and communicated findings in a publication-style report linking submission behavior to outcome risk.

F1 Race Winner Predictor, Personal Project

2024

- Built a supervised pipeline predicting Formula 1 race winners from driver/constructor rolling form, qualifying results, track characteristics, and weather.
- Engineered features such as driver–track history and pit-stop reliability from historical race and weather data. Evaluated on held-out races, the classifier reached 40% race-winner and 60% podium-finish accuracy.

Autonomous Planning & School Knowledge Agents, Personal Project

2026

- Built an autonomous daily-planning agent (Claude Code, Obsidian) that reviews each day's completed work, writes structured notes, and regenerates a time-blocked calendar from a parsed task file and traffic-light priority scheme, cutting daily planning from about 30 minutes to under 2 minutes and saving an estimated 3–4 hours per week.
- Built a companion school-workflow agent that auto-formats lecture and problem-set notes into a cross-linked knowledge base of theorem references, cutting note-cleanup and material-lookup time an estimated 40% to accelerate homework and exam preparation.

TECHNICAL SKILLS

Languages: Python, R, SQL, Java, JavaScript, Bash

Libraries & Frameworks: Pandas, NumPy, scikit-learn, SciPy, statsmodels, Matplotlib, Seaborn

Tools & Platforms: Jupyter, Databricks, Git, GitHub, Excel, L^AT_EX

AI Tools: Claude, Claude Code, Cursor, Hermes, LLM Agents
