EDUCATION

University of Toronto

2023 – Expected Apr 2027

Bachelor of Applied Mathematics Specialist, Statistics Major, Computer-Science Minor

Toronto, ON

Relevant Coursework

Data Structures, Algorithm Design and Analysis, Statistical Computation, Probability and Statistics I/II, Multivariate Data Analysis, Nonlinear Optimization, Graph Theory, Combinatorics

EXPERIENCE

Nextdoor

May 2026 – Present

Machine Learning Intern

San Francisco, CA

- Built and shipped an end-to-end neighborhood ranking feature scoring family-friendliness, turning an open-ended research question into a product deployed to production users.
- Owned the full stack: a data pipeline ingesting external APIs and internal data through Databricks and SQL over tens of thousands of records, a backend scoring service computing the index, and the frontend surfacing ranked recommendations.
- Compared multiple model families to select the production scorer, and improved reliability by resolving bugs across the data pipeline and frontend.

Shopify

May–Aug 2025

Software Engineering Intern

Toronto, ON

- Increased new-merchant activation and retention, routing roughly 100 merchants/day through guided onboarding, by launching a partner-attach system that automatically pairs each new merchant with a vetted onboarding advisor.
- Brought German VAT submissions into compliance with updated tax regulations, unblocking hundreds of affected merchants and reducing compliance risk, by integrating the German tax-code API and aligning Shopify's existing tax flows with the new legal requirements.
- Improved system reliability and reduced recurring issues by resolving cross-disciplinary technical debt assigned by adjacent teams, collaborating with engineering and product stakeholders to ship scalable fixes.

PROJECTS

Autonomous Planning & School Knowledge Agents, Personal Project

2026

- Built an autonomous daily-planning agent (Claude Code, Obsidian) that reviews each day's completed work, writes structured notes, and regenerates a time-blocked calendar from a parsed task file and traffic-light priority scheme, cutting daily planning from about 30 minutes to under 2 minutes and saving an estimated 3–4 hours per week.
- Built a companion school-workflow agent that auto-formats lecture and problem-set notes into a cross-linked knowledge base of theorem references, cutting note-cleanup and material-lookup time an estimated 40% to accelerate homework and exam preparation.

F1 Race Winner Predictor, Personal Project

2024

- Built a supervised ML pipeline predicting Formula 1 race winners, engineering features such as driver-track history, constructor rolling form, qualifying position, pit-stop reliability, and rain probability.
- Assembled and cleaned historical race and weather data into a single modeling dataset, framing per-race win prediction as a classification problem. Evaluated on held-out races, the classifier reached 40% race-winner and 60% podium-finish accuracy.

Student-Outcome Analytics (OULAD), Independent Research [\[Report\]](#)

2026

- Built a data pipeline over 23,301 student-course records, engineering engagement and performance features and applying standardized PCA and varimax factor analysis.
- Benchmarked classifiers under 5-fold cross-validation (logistic regression 67.0% vs. 53.0% baseline), packaging the analysis into a reproducible, publication-style report.

TECHNICAL SKILLS

Languages: Python, Java, JavaScript, SQL, R, Bash, HTML, CSS

Frameworks & Libraries: React, Node.js, Flask, REST APIs, NumPy, Pandas, scikit-learn, Matplotlib

Tools & Platforms: Git, GitHub, Linux/Unix, VS Code, Jupyter, L^AT_EX

AI Tools: Claude, Claude Code, Cursor, Hermes, LLM Agents
